

HOW TO USE SLUSH PUPPY MACHINE

Locate the Slush Puppy machine's electrical cord. As the machine does not require outside refrigeration, simply place the machine where you would like, and plug it into a nearby electrical socket.

Remove the lid from the top of the machine, and add the correct amount of syrup and water to the top slush reservoir. The ratio will change depending on the syrup's sugar content, so follow the direction on the syrup bottle.

Place the cover on the top of the machine, and turn it on. You are not required to mix the contents, as the machine churns the mixture for you.

Wait approximately 30 minutes, and check the machine. Some machines require more than 30 minutes to freeze the drinks, especially if the sugar content of the liquid is low. If 60 minutes has passed and the mixture isn't frozen, turn off the machine and empty the syrup. It will not properly work for the machine, and new syrup is required.

Pump 3 squirts of your favorite flavor into a 16oz. cup and then fill remainder of cup with frozen drink mix from the machine. Stir to combine.

Cleaning Instructions

Turn off and unplug machine. Empty all slush from reservoir by using the spigot, do not attempt to dump reservoir. After all slush mix is removed, fill reservoir with warm soapy water and scrub the interior walls to remove any sugar deposits or crystals. Empty water from reservoir through the spigot and repeat once more. Finally, fill with warm water only and run through spigot until empty and dry with paper towels or cloth.
